# SECOND TERM <br> WEEKLY LESSON NOTES <br> WEEK 9 

| Week Ending: |  | Subject: Mathematics |  |
| :---: | :---: | :---: | :---: |
| Duration: 60MINS |  | Strand: Algebra |  |
| Class: B9 |  | Sub Strand: Variables and Equations |  |
| Content Standard: <br> B9.2.3. I Demonstrate understanding of single variable linear inequalities with rational coefficients |  | Indicator: <br> B9.2.3.I. 3 Solve real-life problems <br> involving linear equations and inequalities | Lesson: <br> I of I |
| Performance Indicator: <br> Learners can translate word problems into mathematical equations and inequalities. |  | Core Competencies: <br> Communication and Collaboration (CC) Critical Thinking and Problem solving (CP) |  |
| References: Mathematics Curriculum Pg. 193 |  |  |  |
| New words: |  |  |  |
| Phase/Duration | Learners Activities |  | Resources |
| PHASE I: <br> STARTER | Engage learners with a "guess the mystery number" game. Give clues that lead to an equation, and let learners solve for the unknown number. <br> Discuss real-life examples where they might use math in their daily lives (e.g., budgeting, cooking, sports). <br> Ask them if they ever encounter situations where equations or inequalities might be helpful. <br> Share performance indicators and introduce the lesson. |  |  |
| PHASE 2: NEW LEARNING | Present several scenario-based word problems involving linear equations and inequalities. Examples could include: <br> - Planning a movie night with popcorn and drinks on a limited budget. <br> - Calculating the distance traveled based on speed and time. <br> - Determining the age range eligible for a school bus pass. <br> Guide learners through analyzing each problem, identifying key information, and recognizing which mathematical concepts apply. |  | manipulatives like counters or algebra tiles |

|  | Example 3: Two sides of a triangle have lengths 6 cm and 8 cm . What is the length of the third side? <br> Note: The sum of the lengths of the two sides of a triangle is greater than the length of the third side <br> If the third side is $x \mathrm{~cm}$ long then, $6+8>\mathrm{x}$ giving $\mathrm{x}<14$ <br> Also, $6+x<8$ giving $x>2$. <br> Also, $8+x>6$ which gives $x>-2 h$ <br> Hence, $2<x<14$. That is, the third side has length between 2 cm and 14 cm . <br> Example 4: <br> Encourage learners to ask questions and clarify any confusion before moving on. <br> Guide learners through the process of solving their mathematical equations or inequalities. <br> Emphasize proper steps like isolating variables, combining like terms, and using appropriate operations. <br> Encourage the use of manipulatives or visuals to aid understanding when necessary. <br> Celebrate finding the solutions and discuss their meaning in the context of the original problem. <br> Assessment <br> A student scores 70 and 76 marks in two tests. How many marks must she score in the third test to be put in Grade A if all learners scoring an average of 80 or higher in three tests are put in grade A ? |  |
| :---: | :---: | :---: |
| PHASE 3: <br> REFLECTION | Use peer discussion and effective questioning to find out from learners what they have learnt during the lesson. <br> Take feedback from learners and summarize the lesson. |  |

| PHASE 2: NEW LEARNING | Guide learners through analyzing each problem, identifying key information, and recognizing which mathematical concepts apply. <br> Break down each scenario into simpler components. Show learners how to translate words like "total cost," "speed," or "age range" into mathematical variables and expressions. <br> Demonstrate how relationships between variables can be written as equations with equal signs or inequalities with comparison signs. <br> Example I: If a student needs an average of 85 in four tests to get Grade A, and their scores in the first three tests are 80,90 , and 88 , what must they score in the fourth test? |  | manipulatives like counters or algebra tiles |

|  | costs $\mathbb{C} 15$. If you spend $\mathbb{C} 85$ without exceeding the discount limit, how many fiction books did you buy? <br> 2. A library charges different fees for fiction and non-fiction books. Fiction books cost $\mathbb{\$} 2$ each, and non-fiction books cost $\mathbb{\$} 3$ each. A student borrowed 7 books in total and paid $\mathbb{C} 17$. How many fiction and non-fiction books did they borrow? <br> 3. At a school fundraiser, you sell homemade cookies for $\mathbb{C} .50$ each and cupcakes for $\mathbb{\$} 2.00$ each. Your goal is to raise $\mathbb{C} 60$. If you only sold 40 items in total, how many of each type did you sell? <br> 4. A toy store offers a special pricing structure where the price of a toy is equal to the child's age multiplied by $\mathbb{\$}$. If a child with 7 years old and another child with 9 years old spend $\mathbb{\$} 54$ together, how many toys did they buy in total? <br> 5. Five friends decide to buy a used textbook together. The book costs $\mathbb{C} 30$, and they want to split the cost equally. However, one friend forgets to pay their share. How much does each of the remaining friends need to pay now? |  |
| :---: | :---: | :---: |
| PHASE 3: <br> REFLECTION | Use peer discussion and effective questioning to find out from learners what they have learnt during the lesson. <br> Take feedback from learners and summarize the lesson. |  |
